"Antiinfluenza Antitoxic Activity of Leucocytic Pyrogen"

Moscow, Voprosy Virusologii, No 4, Jul/Aug 72, pp 439-444

**Abstract:** The prophylactic effect of pyrogen obtained from rabbit leucocytes in peritoneal exudate was studied by injecting pyrogen intravenously into rabbits subsequently infected with A0/32 influenza virus. When injected 24 hours prior to viral infection, pyrogen prevented death and the tissue and vascular destruction typical of influenza intoxication. (The pyrogen also altered the body temperature pattern in response to influenza virus infection, causing disappearance of an early hypothermic phase, and development of a rapid temperature reaction.) A similar reaction was observed with injection of Newcastle disease virus prior to infection. This virus induced formation of interferon and pyrogens in rabbits. Though the mechanisms by which pyrogen increases resistance to virus in intoxication are unknown and require further study, there is now an obvious connection between leucocyte products, including pyrogen, released during intoxication or infection and the increase in body resistance to virus toxin. The possibility of employing leucocytic pyrogen as a prophylactic or therapeutic agent against influenza must be studied.

"Morphogenesis of Experimental Ornithosis Pneumonia"

Moscow, Arkhiv Patologii, Vol 32, No 11, 1970, pp 26-29

**Abstract:** Within 24 hours of intranasal infection of mice with the agent of ornithosis, the virus was found in the alveolar phagocytes, where it multiplied to form microcolonies of elementary particles. The virus was also found in the epithelial cells of the bronchi. The virus-containing cells at first showed no signs of degeneration, and there was no reaction in the adjacent cells. The polymorphonuclear leukocytes reacted only after the virus-filled macrophages were destroyed. They engulfed the viral particles released from the macrophages and then died themselves. The repeated cycles of viral growth in the macrophages and phagocytosis by the polymorphonuclear leukocytes accounts for the protracted course of ornithosis pneumonia.

"Direct Reading Meter for the Standing Wave Coefficient in the Millimeter Range"

Radiotekhnika, Resp. mezhved. nauchno-tekhn. sh. (Radio Engineering. Republic Interdepartmental Scientific and Technical Collection), 1969, vyp. 11, pp 83-88  
(from RZh-Radiotekhnika, No 1, Jan 70, Abstract No 1A318, Resumé)

Translation: This article contains a description of a new direct reading meter for the standing wave coefficient in the millimeter range using an original version of the comparison method. The instrument errors and results of testing it are analyzed. The error in measuring the standing wave coefficient does not exceed 6-8 percent in the entire millimeter range. Means of decreasing the measurement errors are pointed out. There are two illustrations and two entries in the bibliography.

"Investigation of the Laws Governing the Fatigue Failure of Aviation Alloys"

Sb. Nauch. Tr. Kiyev. Inst. Inzh. Gruzhd. Aviatsii (Collection of Works of the Kiev Institute of Civil Aviation Engineers), No 4, 1971, pp 57-61 (from Referativnyy Zhurnal, Mekhanika, No 2, Feb 72, Abstract No 2V1360 by L. M. Shkol'nik)

Translation: A study was made of the influence of the width and length of the working part of a sample upon the rate of growth of fatigue cracks, as well as of scattering of the test results with respect to the moment of appearance of the first macroscopic cracks and the moment of total failure of the sample. The tests were conducted on flat samples of aluminum alloys D16T and V95 with a central aperture, for repeated cyclical elongation with a frequency of 435 cycles per minute. It was established that the length of the samples does not affect their longevity and rate of crack growth. With a width increase of the samples and a length increase of the crack, the growth rate of the cracks increases. Increasing the width of the samples also brings about a decrease of the fatigue-failure stage and of the relative crack length at the moment of failure. With an increase of sample width, the coefficient of stress concentration at the end of a fatigue crack increases. The greatest scattering is

ABSTRACT. IT IS SHOWN THAT ONE OF THE POSSIBILITIES FOR INTENSIFICATION OF HEAT EXCHANGE IS A DISPERSAL OF THERMOELEMENTS WHICH CONSIDERABLY INCREASES THE AREA OF THE RIBBING BASE AND DECREASES HARMFUL TEMPERATURE DROPS BETWEEN JUNCTIONS AND MEDIA. DESIGN RATIOS ARE GIVEN FOR DENSITIES OF HEAT CURRENTS ON JUNCTIONS OF THERMOBATTERIES. SINCE THE OPTIMUM DEGREE OF DISPERSAL OF THERMOELEMENTS CANNOT BE DETERMINED THEORECTICALLY IN A GENERAL FORM, A METHOD OF EXPERIMENTAL DETERMINATION OF THE OPTIMUM DENSITY OF PACKING FOR THE CASE OF NATURAL CONVECTION WAS USED. AN OPTIMUM DESIGN OF THE MODULE FOR A REFRIGERATOR WITH CONVECTIVE COOLING OF HOT JUNCTIONS WAS FOUND. ONE TABLE. THREE ILLUSTRATIONS. SEVEN REFERENCES.

Rock Density at High Pressures

(Abstract: "Study of Density of Rocks from Central Kazakhstan Under High Pressures," by M. P. Volarovich, A. K. Kurskeyev, A. I. Levykin, I. S. Tomashevskaya, I. L. Tuzova and B. M. Urazayev, Institute of Physics of the Earth, Academy of Sciences USSR, and Institute of Geological Sciences, Academy of Sciences Kazakh SSR; Moscow, Izvestiya Akademii Nauk SSR, Fizika Zemli, No. 1, 1970, pp. 46-51)

The density of rocks of various composition from Central Kazakhstan was determined at high pressures in the laboratory. Rock tests were at quasihydrostatic pressures up to 15 kb. The apparatus used made it possible to measure the velocities of elastic waves. The sample was compressed by hard-alloy pistons. Change in volume (from displacement of the piston) was determined simultaneously with measurements of the velocity of longitudinal waves. Change in density at different pressures was computed using the formula

$$\rho = \frac{\rho_0}{1 - \Delta V/V}$$

Reel/Frame  
19780902

AP0045878

where  $\rho_0$  is the initial density of the sample in g/cm<sup>3</sup>,  $\Delta V/V$  is the volume decrement. Change in density was determined with an error of about 5 percent. Samples were selected along two deep seismic sounding profiles. Under the applied pressure density of all rocks increased. Density changes were greatest in the initial phase to 4 kb. Later the changes became less and the density-pressure curves flattened out. The greatest density changes were observed in samples of ancient metamorphosed rocks: schists, gneisses and porphyroids of more acidic composition for which the density changes at 15 kb attain 3.5 percent. The density of granites also changes rather sharply and increases continue to 15 kb. Relative density changes are dependent on initial density: the lesser the density at atmospheric pressure, the greater is the change when pressure is applied. The maximum changes in density for rocks of acidic composition are evidently caused by their greater inhomogeneity than for rocks of basic composition. Acidic rocks are also poorly preserved. Defects in the rock, largely microfissures, close under pressure and density at the attained pressures approaches an identical value for rocks of similar composition. For rocks of basic and ultrabasic composition the density change at pressures up to 15 kb does not exceed 2 percent, that is, the compressibility of rocks of acidic composition is greater than for basic

2/3

19780903

AP0045878

rocks by approximately a factor of 1.5. Density is dependent primarily on chemical and mineralogical composition. Differentiation of rocks by density corresponds to their basicity. The density of sandstones at high pressures approaches the density of granodiorites. Tuff-diorites approach the density of diorites. The density of eclogites from northern Kazakhstan is less than the density of eclogites from other regions. The low density of eclogites in northern Kazakhstan can be attributed to the fact that they contain quartz (up to 15-20 percent). The results of studies of rock densities at high pressures can be used in the geological interpretation of geophysical data. The authors used such data in constructing a density cross section of the crust in central Kazakhstan.

"Effect of Mental Work Accompanied by Nervous and Emotional Stress of Varying  
Degrees on the Cardiovascular System"

Moscow, Kardiologiya, No 3, 1973, pp 50-56

**Abstract:** In addition to making a statistical analysis of 1,585 cases of myocardial infarction among Kiev workers, the authors ran physiological studies on engineers, typesetters, mathematicians, and neurosurgeons. They found that the effects of mental work on the cardiovascular system vary with the degree of nervous tension and some other factors. The manifestations range from incipient functional disturbances of regulation to severe pathology. Moderate tension elevates blood pressure, the increase in systolic and diastolic pressures being related. Great tension, however, tends to disrupt the relationship probably because the centers regulating vascular tonus become uncoordinated. Intense nervous and emotional strain increases the heart beat as well as the "slow" waves among the periodic constituents of the correlation function of

1/2

the cardiac rhythm, an indication of an intensification of central neuroendo-  
crine influences on cardiac activity. As the tempo of work and degree of  
emotional stress increase, the amount of catecholamines and 17-hydroxycorticoids  
excreted with urine also gradually increases. Thus, tense mental work markedly  
affects the cardiovascular system and adrenal cortex.

"Catecholamines and Their Relationship to Cardiovascular Shifts in Mental Work  
Involving Different Degrees of Nervous and Emotional Tension"

Kiev, Vrachebnoye Delo, No 8, Aug 72, pp 135-138

Abstract: The degree of secretion of catecholamines in relation to cardiovascular shifts in various types of mental work differing with respect to nervous and emotional strain was studied on engineers, type setters, and neurosurgeons. Under high emotional strain (e.g., that to which neurosurgeons are subjected), the rate of excretion of adrenaline and noradrenaline, particularly that of noradrenaline, increased significantly. Activation of the sympathetic-adrenal system, accompanied by an increased formation of catecholamines, may have a harmful effect on cardiac activity, increasing the requirement of coronary vessels for oxygen and producing hypoxia. A high incidence of hypertension, coronary atherosclerosis, and myocardial infarction in persons whose mental work involves a high degree of emotional strain (e.g., leading engineers of industrial enterprises) has been established. Observation by cardiologists of the state of the cardiovascular system in mental workers whose activity involves a great amount of neuro-emotional strain is advisable.

"Principles for Quantitative Evaluation of the Difficulty and Strenuousness  
of Work on the Basis of Physiological Data"  
Moscow, Gigiiena Truda i Professional'nyye Zabolevaniya, No 7, 1971, pp 3-9

**Abstract:** A four-level classification of jobs by difficulty and stress is proposed on the basis of research conducted by the Institute and the literature data. The criteria used to measure the amount of effort involved as well as the changes therein during the course of the workday include energy consumption (ranging from under 150 kcal/hour for class 1 work, e.g., computer programming, to 351 kcal/hour or more for class 4 work, e.g., steel casting), muscular, cardiovascular, central nervous, and endocrine functions. A table lists average values of several physiological functions in different kinds of work while another evaluates the difficulty and strenuousness of different kinds of jobs (e.g., operation of office machines is classified as class 1 in difficulty and class 2 in strenuousness, lathework 2 and 2, steel casting 4 1/2

- 63 -

"Cobalt as a Trace Element in the Anode Part of Alkali Batteries"

Sb. rabot no khim. istachnikam toka. Vses. n.-n akkumulyator. in-t (Collection of Works on the Chemical Source of Current. All-Union Scientific Study Institute for Storage Batteries) Vyp 7, 1972, pp 118-123 (from Referativnyy Zhurnal -- Khimiya, No 8(II), 1973, Abstract No 8L240 by V. S. Levinson)

Translation: The influence was determined of traces of cobalt in the form of a metallic powder and as different compounds in the positive working terminal on the capacity of alkaline batteries of the type TZHNK-300. The greatest effect was shown by the compound  $\text{CoSO}_4$  in the form of a saturated solution, approximately 3%. Under these conditions, the capacity of the batteries increased approximately 20% with a concomitant improvement in its power at higher temperatures ( $40^\circ\text{C}$ ) for conditions of a small reduction in the discharge current. The actual specific energy of batteries having cobalt additions with unlaminated negative and laminated positive electrodes was 73.5 watt hours/1 and 34 watt hours/kg. Such batteries are recommended for application for loading machines.

"Diagnostic Significance of the Sensation of Frequency Changes in the Modulation  
of Sound Intensity"

Kiev, Zhurnal Ushnykh, Nosovykh, i Gorlovых Bolezney, No 5, Sep/Oct 71,  
pp 30-38

**Abstract:** Thresholds of differentiation of sound intensity modulation frequencies were studied in five persons with normal hearing and 39 persons with functional auditory disorders. Tests were made with threshold tonal audiometry, speech audiometry, and noise audiometry. Apparently, a lowering of the threshold of differentiation of sound intensity with impaired reception, regardless of modulation frequency, under certain conditions raises the apperception of speech as a result of physiological recruitment. With progressive auditory impairment, however, such recruitment disappears and apperception deteriorates. Comparison of thresholds of differentiation of sound intensity at different modulation frequencies was found to be of diagnostic significance, helping to determine the cause of disruption of speech apperception in certain forms of cochlear neurites.

"Investigation of the Effect of Palladium on the Engineering, Mechanical and  
Corrosion Properties of Titanium Alloys OT4 and VT14"

Moscow, Zashchita Metallov, Vol 9, No 6, 1973, pp 672-675

Abstract: The possibility of increasing the corrosion resistance of titanium  
alloys OT4 and VT14 by means of alloying with 0.2% Pd was studied. The alloys  
were produced in a vacuum-arc furnace with the palladium added in the form of  
powder. Structure of OT4 and OT4+0.2% Pd was the alpha-solid solution, and  
VT14 and VT14+0.2% Pd--fine grains of the alpha- and alpha"-phases inside a  
beta-matrix. Strength properties of the titanium alloys were improved somewhat  
with the addition of palladium while ductility was lowered. The addition of  
2.0% Pd significantly lowered the oxidation tendency of the alloys at 600 and  
800°C, and especially at 1000°C. 3 figures, 4 tables, 6 bibliographic refer-  
ences.

"The Effect of Alloying Elements on the Corrosion Behavior of Titanium"  
Moscow, Zashchita Metallov, Vol 9, No 1, Jan-Feb 73, pp 10-15

**Abstract:** The method of potentiostatic polarization curves, corrosion tests, and electron diffraction investigations were applied to investigate the corrosion and electrochemical properties of alloys based on titanium iodide with small additions of chromium, molybdenum, niobium, aluminum, manganese, and tin in a 40%  $H_2SO_4$  solution at 80° under natural aeration conditions.

The structure of the anodic oxide films developing on these alloys was analyzed. The passivation and full passivation potentials were found to be practically independent of the nature and concentration of the alloying addition, whereas the critical passivation currents and the currents in the passive zone varied significantly. Aluminum impairs the corrosion properties of titanium both in the active and passive states. Manganese and chromium increase the rate of corrosion in the active state and decrease it in the passive state. Niobium, on the other hand, reduces titanium corrosion rate in the active state and increases it in the passive state. One figure, three tables, thirteen bibliographic references.

"Effect of Ruthenium on the Corrosion Behavior of Titanium"

Moscow, Zashchita mettallov, Vol 8, No 2, Mar-Apr 72, pp 174-177

**Abstract:** This paper deals with the effect of ruthenium on the passivation and corrosion resistance of titanium as compared to the passivation effectiveness of palladium. The marked difference between the corrosion behavior of Ti alloys with Ru and Pd is explained by the difference of hydrogenation and cathodic polarization. Added in small amounts to Ti, Ru hydrogenates to a lesser degree than Pd and is therefore a more effective cathode capable of converting Ti to the passive state. It is essential that unlike Pd, even minimal Ru additions (0.01 - 0.05%), while insufficient to

1/2

- USSR

TOMASHOV, N. D., et al, Zashchita metallov, Vol 8, No 2, Mar-Apr 72  
pp 174-177

provide complete passivation of the alloy, will not increase its corrosion rate as compared to pure Ti. At higher contents (above 0.1%) the difference in the cathodic effects of Ru and Pd levels off. It appears that Ti alloys inoculated with very small amounts of Ru (0.05 - 0.1%) may be of practical interest under certain corrosion conditions (4 illustr., 12 bibliog. ref)

"Study of the Corrosion Resistance of Alloys of the Titanium-Tantalum--  
Niobium System"

Moscow, Zashchita metallov, Vol 8, No 1, Jan-Feb 72, pp 3-7

**Abstract:** Tantalum effectively raises the corrosion resistance of titanium-base alloys; its use, however, is limited due to cost factors and scarcity. The study of the ternary Ti-Ta-Nb system is essential for determining the feasibility of partial replacement of tantalum with the more readily available niobium. The corrosion and electrochemical behavior of the alloys was studied as annealed and quenched in a 5% HCl solution at 100°C. Analysis of the phase transformation and microstructure of the alloy indicates an isothermal section at 600°C which is characterized by a narrow region of  $\alpha$ -solid solution, a wide two-phase ( $\alpha+\beta$ ) region, and a wide region of  $\alpha$ -solid solution. At about the same average compositions, Ti-Ta-Nb alloys with single-phase structures exhibit corrosion resistance values which are one or two orders of magnitude higher than those shown by two-phase alloys. The higher resistance is characteristic of annealed Ti-Ta-Nb alloys with

1/2

USSR

TOMASHOV, N. D., et al., Zashchita metallov, Vol 8, No 1, Jan-Feb 72, pp 3-7  
a more stable  $\beta$ -phase. Alloying of Ti with Nb and, specifically, with Ta  
results in a considerable increase in corrosion resistance, the total con-  
tent of alloying elements, ranging from 20-40% for annealed and 10% for  
quenched alloys. The study demonstrates the feasibility of replacing  
tantalum with niobium without reducing markedly the corrosion resistance  
of the above alloys. (3 illustrations, 1 table, 9 bibliographic references).

"Study on the Corrosion of Titanium Alloyed With 0.2% Palladium in Hydrochloric Acid Using the Radioactive Tracer Method"

Moscow, Zashchita metallov, Vol 8, No 1, Jan-Feb 72, pp 8-14

**Abstract:** The study of palladium dissolution rate at various stages of corrosion conducted on a titanium alloy with 0.2% palladium in both aerated and deaerated 20% solutions of hydrochloric acid using the radioactive tracer method indicates that the transfer of palladium into the solution takes place at room temperatures. Rotating the specimen increases the transfer rate of palladium into solution and decreases its amount on the surface which is apparently related to the mechanical removal of some of the palladium from the specimen's surface. The study of the kinetics of palladium transfer to both aerated and deaerated solutions indicates that palladium transfer to the aerated solution ceases on passivation while the transfer to a deaerated solution continues for the entire period of active dissolution of the alloy. It is suggested that the ionization of palladium

USSR

UZBEKOV, A. A., et al, Zashchita metallov, Vol 8, No 1, Jan-Feb 72, pp 8-14  
from the Ti-0.2% Pd alloy begins only with the loss of contact of the  
palladium particles (or  $Ti_2Pd$  intermetallides) with the surface of the alloy  
and the subsequent displacement of their potential toward the positive  
side. A schematic diagram of the experimental equipment is presented.

"Crevice Corrosion of Titanium and its Alloy with 0.2% Palladium  
in Hydrochloric Solutions"

Moscow, Zashchita metallov, Vol 8, No 2, Mar-Apr 72, pp 177-181

**Abstract:** Described are the results of corrosion tests on specimens of VT-1 titanium and Ti alloys with 0.2% palladium under crevice corrosion conditions in both aerated and deaerated hydrochloric solutions using argon. The test results indicate that Ti alloy with 0.2% Pd -- as compared to pure Ti -- not only is capable of maintaining a higher corrosion resistance in the crevice than in the bulk of the solution but will also promote the passivation of pure Ti provided the crevice is formed by the specimen pair Ti-Ti alloy with 0.2% Pd in the state of electric contact. "The Electrochemical Behavior of Metal Ceramic Titanium"

Moscow, Zashchita Metallov, Vol 10, No 1, Jan-Feb 74, pp 22-27

**Abstract:** The electrochemical behavior of specimens of titanium produced by powder metallurgy methods in 20% HCl is studied. The cathodic and anodic behavior of specimens and the change in potential of inner layers upon polarization of the surface are studied. The true surface of the specimens is defined by measurement of the capacitance of the binary layer. Cylindrical specimens 22 mm in diameter and 6 mm high were pressed from electrochemical titanium powder with particle sizes of 100-180  $\mu$  with microdendritic structure at pressures of 12-60 t/cm<sup>2</sup> with subsequent sintering in a vacuum at 1100°. It is established that the decrease in active surface is more intensive than the decrease in porosity, apparently related to the decrease in depth of penetration

pp 22-27

of the electrochemical process for specimens with lower porosity. The primary difference in electrochemical behavior of an electrode of porous titanium from that of compact titanium electrodes is the possibility of occurrence of the process not only on the surface, but also in the volume of the specimen.

"Corrosion Behavior of Titanium and Its Alloys with Palladium During Heat Transfer in Moving Solutions"

Moscow, Zashchita Metallov, Vol 10, No 1, Jan-Feb 74, pp 28-32

**Abstract:** The influence of heat transfer and motion of hydrochloric acid on the corrosion behavior of titanium and its alloy with 0.2% Pd is studied using a rotating heat transmitting disc electrode designed by the Ukrainian Scientific Research Institute for Chemistry. The saturation of solutions of hydrochloric acid with air causes an increase in the temperature boundary of corrosion stability of titanium and its alloys with 0.2% palladium. The boundaries of corrosion stability of titanium and its palladium alloy in solutions of hydrochloric acid depend on the wall and medium temperature, the temperature drop and the direction of the heat flux. Upon transition of laminar flow mode around a disc to turbulent flow, the temperature boundaries of corrosion stability in aerated solutions of hydrochloric acid increase.

TOMASHOV, N. D., and CHERNOVA, G. P.Korroziya i Korrozionnostoykiye Splavy (Corrosion and Corrosion-Resistant Alloys), Moscow, "Metallurgiya," 1973, 232 pp

**Translation of Annotation:** This book considers the theories of corrosion processes, localized corrosion (such as pitting, intercrystallite corrosion, fractures), and corrosion during the simultaneous action of mechanical loading (corrosion cracking, corrosion fatigue, and cavitation). Scientific principles are given for making metal alloys having high passivity and corrosion resistance. The properties of the major contemporary corrosion-resistant alloys used in construction are described.

This monograph is of interest to both scientific and engineering personnel, and builders dealing with problems of corrosion, anticorrosion protection, and the application of alloys to increase corrosion resistance. 76 Illustrations, 12 Tables, and 138 references.

"Oscillographic Study of the Self-Passivation of Titanium After Surface  
Dressing in NaCl Solutions"

Moscow, Zashchita Metallov, Vol 9, No 3, May/Jun 73, pp 250-255

**Abstract:** The authors studied oscillographic curves for the potential drop of a titanium electrode after its surface had been cleaned under a sodium chloride solution. The experiments were done on specimens of iodide titanium (TsMTU 05-18-67, HB 66.5) which was remelted in an arc furnace with consumable electrode in a helium atmosphere, forged and annealed in a vacuum ( $10^{-4}$  mm Hg) at 650°C for 40 minutes. Specimens 6 mm in diameter were pressed into Teflon holders so that only one end surface was exposed. Before the experiments, the specimens were cleaned with M-28 abrasive paper, degreased with acetone and rinsed with distilled water. The installation used for cleaning the surface under sodium chloride was described in a previous paper (N. D. Tomashov, R. M. Al'tovskiy, G. P. Chernova, "A Device for Electrochemical Study of Metals During Surface Cleaning Under a Solu-

N. D. et al., *Zashchita Metallov*, Vol 9, No 3, May/Jun 73, pp  
tion", Moscow, VINITI, theme No 13, No M-58-94/7, 1958). The rate of ro-  
tation of the Corundum disc was 1320 rpm (linear velocity of grinding with  
respect to the center of the specimen 3.11 m/s), and the speed of recip-  
rocating motion of the disc was 2.15 mm/hr (600 nm/s), corundum grain size  
was 57-76  $\mu\text{m}$ . After 15 minutes of surface dressing, the wheel was removed  
from the specimen and the change in potential of the specimen with time  
was measured. For the first five seconds the measurements were made on the  
S1-19A CRT oscilloscope, after which an N-39 chart-recording millivoltmeter  
was used in some cases. The LPU-01 pH meter was used as a high-impedance  
amplifier. Cathode polarization curves were plotted at a rate of 1.2 V/hr  
using the P-5827 potentiostat in a three-electrode cell. A saturated  
calomel comparison electrode was used. It was found that the self-passi-  
vation of titanium is slowed down considerably in neutral solutions by in-  
creasing the concentration of chlorine anions and reducing the concentra-  
tion of dissolved oxygen. In dilute aerated sodium chloride solutions,  
titanium is covered to a considerable extent by a chemisorption layer of  
oxygen even with continuous mechanical surface cleaning under solution.

"Corrosion and Corrosion-Resistant Alloys"

Korroziya i Korrozionnostoykiye Splavy. [English version above], Moscow,  
Metallurgiya Press, 1973, 232 pp (Translated from Referativnyy Zhurnal  
Metallurgiya, No 8, 1973, Abstract No 81698K, by O. Pimenova).

Translation: This monograph presents the most important statements from the theory of corrosion processes. Particular attention is given to the most dangerous types of corrosion damage (pitting and intercrystalline corrosion) and the influence of mechanical factors on corrosion processes, as well as the basic principles of creation of corrosion-resistant alloys. The principle and possibilities of cathode modification of alloys in order to increase their corrosion resistance are described in detail. A brief review and primary characteristics are presented from the most important modern corrosion-resistant alloys, primarily those based on Fe.

"Structural Study of Surface Layer on Ti-Pd Alloys"  
Moscow, Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 291-294

**Abstract:** The article describes results of an electron microscopic, electron diffraction, and X-ray study of the surface layer forming on Ti-Pd alloy (Ti-0.2 percent Pd and Ti-1 percent Pd) during corrosion in 40 percent  $H_2SO_4$  and 20 percent HCl at 100°. The electron microscopic study of the surface of Ti-Pd alloys after their corrosion confirms the supposition as to the accumulation of palladium on the surface in the form of very finely dispersed crystalline formations. After treatment of the surface with hot concentrated  $HNO_3$ , which dissolves Pd, the electron microphotographs show no particles. In the case of Ti-1 percent Pd palladium mainly forms very fine particles on the surface. The Pd accumulations on Ti-0.2 percent Pd alloy reveal a tendency towards the branched growth of primary crystallization centers.

1/3

USSR

294

TOMASHOV, N. D., et al., Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 291-

The results of the electron diffraction study of the surface of Ti-1 percent Pd alloy show that after corrosion in 20 percent HCl at 100° there are strong lines characteristic of Pd and very weak lines characteristic of  $TiO_2$  and  $TiH_2$ . After treatment of the alloy in  $HNO_3$  the lines characteristic of Pd disappear, and only  $TiH_2$  and  $TiO_2$  are found on the surface. The relative intensity of the reflections characteristic of Pd increases with an increase in the corrosion time, while it decreases for  $TiH_2$  and  $TiO_2$ . After corrosion in 40 percent  $H_2SO_4$  at 100° reflections characteristic of Pd,  $TiH_2$ , and  $TiO_2$  are observed. However, the intensity of the Pd-characteristic lines is considerably weaker than after corrosion in 20 percent HCl at 100°, and they are of a diffuse character, while the intensity of the reflections characteristic of  $TiH_2$  and  $TiO_2$  is stronger.

X-ray analysis of the powdered surface layer that forms on Ti-1 percent Pd alloy shows that after corrosion in 20 percent HCl at 100° the alloy

2/3

USSR

294

preferentially contains metallic palladium. After corrosion of the alloy in  
40 percent H<sub>2</sub>SO<sub>4</sub> at 100°, along with the strongest Pd lines, considerably  
weaker lines characteristic of Ti<sub>2</sub>N are observed.

"Investigation of the Structure and Corrosion Behavior of  
Alloys of the System Ti - Ta - Cr"

Moscow, Zashchita Metallov, Vol 7, No. 4, Jul-Aug 71, pp 387 -391

Abstract : The structure and corrosion behavior of alloys of the system Ti - Ta - Cr , containing Cr from 2.5 -20 % and Ta up to 30 %, were investigated, using for the analysis of the phase equilibrium the microstructure, roentgenophase, differential-thermal, and dilatometry methods and characteristic diagrams of the alloys subjected to hot plastic deformations in the temperature interval of 1,000 -600 deg. and subsequent hardening ( 1,200 -600 deg. ). Depending on the temperature of heat treatment, these alloys can

1/2

USSR

TOMASHOV, N. D., et al., Zashchita Metallov, Vol 7, No 4, Jul.-Aug 71,  
pp 387-391

have a homogeneous structure of a  $\beta$ -solid solution or a heterogeneous structure  $\alpha + \beta + \gamma$ . The investigation results are discussed by reference to the shown microstructure and diagrams of polythermal cuts of the alloys by different correlation of their components and effects of the alloying components on the corrosion rate. It was found that the stability region of the  $\beta$ -phase on the state diagram increases and the beginning eutectoid transformation  $\beta \rightarrow \alpha + \gamma$  shifts into the region of higher contents of alloying elements and lower temperatures by increasing the relative content of Ta to Cr relations of 1:3, 1:1, and 3:1. The corrosion rate of alloys with homogeneous structure is lower than that of alloys with heterogeneous structure by 2-10 times and more. The Ti - Ta - Cr alloys with Ta:Cr=3:1 and the Ti - Ta alloys with a Ta-content of 20 % and higher are corrosion-resistant in 5 % HCl at 100 deg. The Cr-alloying of Ti decreases its corrosion properties in the HCl-solution and the corrosion rate increases with increasing Cr-content, particularly for alloys with heterogeneous structure. Four illustr., eight biblio. refs.

"The Effect of Phase Composition of Ti-15% Mo alloys on Its Corrosion Behavior  
in the Active State"

Moscow, Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

**Abstract:** The corrosion behavior of Ti alloys with 15.1% Mo with a  $\beta$  structure was studied. The alloy was prepared from titanium iodide with the addition of molybdenum, first subjecting it to crucibleless electron-radiation zone smelting. The smelting was carried out in an arc furnace with non-consumed tungsten electrodes in the holes of a water cooled copper tray in an atmosphere of spectrally pure helium. At the same time a control with titanium iodide was run in one of the holes. If the hardness of the titanium as a result of smelting was increased due to gas adsorption much more than 10 units on the Vickers scale, the melt was discarded. The 50 g ingots obtained were forged at  $900^{\circ}$  into rods and sheets. Finally, after removing the scale and surfaces defects, it was rolled into strips.

Thermal processing of the samples was carried out by heating evacuated and sealed ampules in a muffle furnace for 30 min. at  $950^{\circ}$ . They were then  
1/3

USSR

TOMASHOV, D. N., et al., Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

transferred to a water bath and fast mixing the ampule was broken. The samples prepared in this fashion had a Vickers hardness  $H_V$  of 10/30 - 190. Before the electrochemical studies, the samples were cleaned with sand-paper, degreased with acetone, washed with distilled water, and dried in a dessicator for not more than 1 day over  $\text{CaCl}_2$ . The tests were carried out with natural aeration in 40% sulfuric acid solutions at different temperatures.

Since samples with a  $\beta$  and  $\beta + \omega$  structure with a spontaneous natural air oxide film are not activated at temperatures below  $85^\circ$ , and with a  $\beta + \alpha$  structure below  $70^\circ$ , a preliminary activation (1 min. in the same acid) of the alloys with a  $\beta$  and  $\beta + \omega$  structure at  $90^\circ$  and with a  $\beta + \alpha$  structure at  $75^\circ$  was carried out. Without activation the melt remained in the passive state, having a positive stationary potential (e.g., 0.1 v at  $80^\circ$  for alloys  $\beta$  and  $\beta + \omega$ ) and a lower velocity of corrosion ( $10.09 \text{ g/m}^2 \cdot \text{hr}$ ). After activation the alloy was steadily dissolved in an active state with significant velocity.

A significant effect is shown by the phase composition of Ti - 15% Mo alloy on its corrosion in the activated condition. A much higher corrosion resistance is observed with the single phase  $\beta$  alloy, the least with the two phase  $\beta + \alpha$  alloy. This was determined by the much higher resistance  
z/3

USSR

TOMASHOV, N. D., et al., Zashchita Metallov, Vol 7, No 5, 1971, pp 507-513

of the  $\beta$ -phase containing, in comparison to the  $\alpha$  and  $\omega$  phases, a higher Mo content. Thus, for maximum increase in the resistance of titanium alloys, alloys with a  $\beta$ -stabilizer (e.g., Mo, Nb, V) it follows that it is possible to apply a thermal processing which will promote the conservation of a single phase  $\beta$  state.

It was also shown that a significant deterioration in the corrosion properties of Ti-Mo alloy occurred in the presence of the metastable  $\omega$ -phase. In the diffusion of two phase  $\beta + \alpha$  and  $\beta + \omega$  alloys in the activated state in the region of a potential of 0.260-0.140 v, a concentrated Mo phase accumulates on the surface.

"Corrosion Behavior of Titanium-Molybdenum-Chromium Alloys"

Moscow, Zashchita Metallov, Vol 6, No 5, Sep-Oct 70, pp 499-504

**Abstract:** This paper deals with the effect of chromium on the corrosion resistance of titanium alloys containing 5 and 10% molybdenum. The electrochemical and corrosion behavior of the alloys was studied by potentiometry, both the current and weight losses being the indicators of the corrosion rate. It has been shown that the  $\beta$ -phase of titanium alloys containing a stable (under the testing conditions) component such as molybdenum, possesses elevated corrosion resistance. In the active dissolution of two-phase  $\alpha+\beta$ -alloys of titanium with molybdenum, predominantly the  $\alpha$ -phase goes into solution, while the  $\beta$ -phase remains at the surface in the form of a finely disperse layer. In the passive

1/2

USSR

TOMASHOV, N. D., et al, Zashchita Metallov, Vol. 6, No. 5, Sep-Oct 70,  
pp 499-504

dissolution in nonoxidizing media, the corrosion rate of Ti-Mo-Cr alloys markedly decreases only on addition of chromium in an amount sufficient for producing single-phase  $\beta$ -alloys (Ti-5Mo-10Cr and Ti-10Mo-10Cr); however, if the alloys have an  $\alpha+\beta$ -structure, then the corrosion rate remains about the same (as compared to Ti-Mo alloys). Chromium addition reduces the tendency of alloys to over-passivation, which is caused by the presence of Mo, and the Ti-5Mo-10Cr alloy exhibits the same low corrosion rate within 0.15 to 1.2 v as titanium or Ti-10Cr alloy. At potentials which are more positive than 1.2 v, the corrosion rate of Ti-Mo-Cr alloys begins to increase owing to the tendency of chromium to over-passivation.

"Effect of Palladium on the Corrosion and Electrochemical Behavior of OKh25N6T Steel"

Moscow, Zashchita Metallov, Vol. 6, no. 4, Jul-Aug 70, pp 425-427

**Abstract:** This study concerns the effect of palladium on the corrosion of OKh25N6T steel in 10 and 20% sulfuric acid at 100°C and free access of air. The study shows that in 20% sulfuric acid at 100°C the corrosion rate of OKh25N6T steel alloyed with palladium is lower by one order of magnitude. However, since the corrosion potentials of steels with palladium fail to attain stable passivity, the steels continue to dissolve at a considerable rate. In 10% sulfuric acid at 100°C, a steel with 0.5 palladium after a period of active dissolution is in a completely passive state and the corrosion rate is four orders of magnitude lower than in passive-active state. The obtained data suggest that the passivation of chromium steels alloyed with nickel (6%) and palladium (0.1--0.5%) occurs in two stages. The first one

TOMASHOV, N. D., et al, Zashchita Metallov, Vol. 6, no. 4, Jul-Aug 70, pp 425-427

(at a potential of -0.22 v) is controlled by the buildup of nickel on the surface of the alloy, while the second (-0.12 v) --- is controlled by the buildup of palladium. The nickel buildup stage is completed by the partial nickel passivation to its stationary potential (-0.12 v); the palladium buildup stage results in a more thorough passivation to potential of +0.01 v which corresponds to the cathodic process of hydrogen liberation on palladium. Steels with 0.5 palladium affected by oxygen depolarization (with free access of air) may even exhibit a more thorough passivation up to potentials of the order of 0.5 v followed by a steep rise in corrosion resistance.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A METHOD OF CONTINUOUS MECH. RENEWAL (SCOURING) OF THE WHOLE REACTION SURFACE OF A SOLID METAL ELECTRODE WAS USED FOR INVESTIGATION OF THE KINETICS OF VARIOUS CHARACTERISTIC ELECTRODE PROCESSES. CATHODIC PROCESSES OF H EVOLUTION ON PD, NI, FE, Pb, Sn, O IONIZATION ON PD, ACTIVE ANODIC DISSOLN. (FE, NI, Pb, Sn), ANODIC PASSIVITY (Ti, Cr, Ni), AS WELL AS THE EFFECT OF ADSORPTION OF SURFACE ACTIVE ANIONS ON THE KINETICS OF ELECTRODE AND CORROSION PROCESSES ON FE AND NI, WERE STUDIED. DIFFUSION INHIBITION OF AN ELECTRODE PROCESS IS ELIMINATED BY VIGOROUS STIRRING OF THE SOLN. VIGOROUS MECH. SURFACE RENEWAL DEPENDING ON THE NATURE OF THE IONS BEING ADSORBED, THEIR CONCNS., AND ELECTRODE POTENTIAL. INHIBITION OF THE MECH. SURFACE SCOURING. COMPARISON OF KINETICS OF ELECTRODE PROCESSES WITH OR WITHOUT CONTINUOUS RENEWAL OF THE METAL ELECTRODE SURFACE ALLOWS A QUANT. EVALUATION OF THE DEGREE OF INHIBITION OF THE TOTAL ELECTRODE PROCESS BY ITS INDIVIDUAL STEPS.

"A Device for Protecting the Front Surface of Optical Systems"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki,  
No 6, Feb 72, Author's Certificate No 328411, Division G, filed 20 Aug 69,  
published 2 Feb 72, p 143

Translation: This Author's Certificate introduces a device for protecting the front of optical systems from atmospheric contaminants. The device contains a fitting which mates with the mount of the optical system and has a joint for feeding in compressed gas. As a distinguishing feature of the patent, in order to preserve image quality, the unit for feeding in gas is made in the form of a gas-collecting chamber with guide channels which goes into a blower nozzle.

"Vacuum Evaporation of Barium Titanate"

Moscow, Izvestiya Akademii Nauk SSSR, Neorganicheskiye Materialy, No 8,  
1972, pp 1446-1450

**Abstract:** Vacuum condensates of barium titanate have been studied in a number of works; however, thin ferroelectrical films of barium titanate with optimal properties have not yet been produced. This work studies the microcompositions and structure of films produced by discrete evaporation of barium titanate and estimates the effectiveness of this method for manufacturing thin stoichiometric layers. The films produced are 500-5000 Å thick. The possibilities of producing stoichiometric films by the ordinary method of discrete evaporation are limited. In most cases, the films contain an excess of barium oxide, unevenly distributed over the area of the film. Stoichiometry is better maintained on monocrystalline substrates and depends little on their temperature. A modification of the method of discrete evaporation allows barium titanate films to be produced with clear ferroelectric effect. The modification consists in correcting the excess of barium in the condensate, determined primarily by the substrate material and the condensation rate. This modified method produced films with good structural formation, and dielectric permeability with a maximum in the area of 120°C. At room temperature, dielectric hysteresis loops were observed, which disappeared at over 120°C.

"Determination of Probability of Detection of an Object with Two-Stage Search"

Teoriya Optimal'n. Resheniy [The Theory of Optimal Decisions -- Collection of Works], Kiev, 1972, pp 127-130 (Translated from Referativnyy Zhurnal, Kibernetika, No 3, Moscow, 1973, Abstract No 3 V300 by the authors).

Translation: One typical problem in search systems is two-stage search for objects in a region. One variety of this problem is presearch, when the observer is already located in the area of possible positions of the target and goes over to the use of detection methods assuring more precise determination of the location of the target than in the preceding stage of search. One of the basic indicators of effectiveness of solution of this problem is the probability of detection of an object, which depends on the accuracy of determination of the location of the target during the search stage and the characteristics of the detection apparatus used in presearch. An expression is produced for this probability in one natural case.

"Effect of the Calcining Temperature of the Charge on the Luminescence of Calcium Tungstate"

Sb. nauch. tr. VNII lyuminoforov i osoboi chist. veshchestv (Collection of Scientific Works of the All-Union Scientific Research Institute of Lumino-phors and Materials of Extreme Purity), 1972, vyp. 7, pp 18-26 (from RZh-Khimiya, No 6 (II), 1973, Abstract No 6L161)

Translation: A sharp difference was discovered in the dependence of the photoluminescence and x-ray luminescence of calcium tungstate on the calcining temperature of the charge. It is explained by the presence during x-ray excitation of an energy migration stage with respect to the crystal. For this reason, at temperatures <400° the intensity of the x-ray luminescence is low as a result of the high concentration of linear and surface defects; the extinguishing of the x-ray luminescence is caused by the introduction of acid complexes of the group V elements, four of which (As, Sb, Ng, Ta) increase the afterglow of the CaWO<sub>4</sub>, and the fifth (P) decreases it. Above 800° the recombination afterglow increases sharply in connection with the accumulation of CaO. The bibliography has 19 entries.

lected Scientific Works of the All-Union Scientific Research  
Institute of Phosphors and Extra Pure Materials), 1971, vyp. 5,  
pp 133-143 (from RZh-Khimika, No 7, Apr 72, Abstract No 7L177)

Translation: Colloidalchemical phenomena play an important part in the process of deposition of ZnS and CdS and calcium tungstate. The grain size of the deposit is determined both by the growth of the microcrystals which form the nuclei of the first colloidal particles, and by the process of coagulation leading to formation of larger aggregates. On the basis of these considerations, the authors explain a number of phenomena observed in the course of the study, in particular the formation of large (>12 microns) spherical granules of ZnS with intense and uniform agitation of the  $ZnSO_4$  solution through which  $H_2S$  is bubbled, the formation of CdS platelets up to 500-700 microns long in the case 1/2

GURVICH, A. M., et al, Sib nauch. tr. VNIIL luminoferov i osoto chist. veshchestv, 1971, vyp 5, pp 133-143.

of high initial acidity (3.3-3.6 n.) of the  $\text{CdSO}_4 + \text{H}_2\text{SO}_4$  solution, an abrupt increase in the  $\text{CaWO}_4$  grain size with a reduction in the concentration of  $\text{CaCl}_2$  to 1%, the absence of a direct relation between the grain sizes of the deposits and the luminescent compositions made from them, etc. The concentration of coprecipitated oxygen-containing impurities can be appreciably reduced and the bulk density of the sulfide can be increased from 1.5-1.6 to 2.8 g/cc by using intense agitation of the solution during zinc sulfide deposition, and also by bubbling  $\text{H}_2\text{S}$  through the rinse water. Bibliography of 16 titles. Resumé.

3,MERCAPTO,5,HYDROXY,6,(2,METHYLMINOPHENYL),1,2,4,TRIAZINE (I), M.  
210DEGREES. HEATING 2,METHYL,3,MERCAPTO,5,HYDROXY,6,(2,  
AMINOPHENYL),1,2,4,TRIAZINE WITH MEI IN MEOH IN A SEALED TUBE AT  
140DEGREES GAVE A MIXT. FROM WHICH WAS ISOLATED SOME I, AS WELL AS  
3,9,DIMETHYL,2,3,DIHYDRO 1,3,4,TRIAZA,2,CARBAZOLENE, M. 255DEGREES. THE  
YIELDS OF THIS INCREASED WITH PROLONGATION OF THE REACTION AND ELEVATION  
OF THE TEMP. HEATING 3,5,0THYDROXY,6,(2,AMINO PHENYL) 1,2,4,TRIAZINE  
(II) WITH 1:1 HCL IN A SEALED TUBE 5-10 HR AT 160DEGREES GAVE  
2,HYDROXY,1,3,4,TRIAZACARBAZOLE, M. SMALLER THAN 320DEGREES. EVIDENTLY  
IN REACTION OF ALKALI WITH N METHYLISATIN  
BETA-(2,METHYL)THIOSEMICARBAZONE TO FORM  
5-OXO-6,(2,AMINOPHENYL),1,2,4,TRIAZINE, THE CYCLIZATION TAKES PLACE  
FIRST, THEN OPENING OF THE 1,3,4,TRIAZACARBAZOLE RING; SIMILAR REACTION  
OF ISATIN BETA SEMICARBAZONE PROCEEDS THROUGH REVERSED ORDER OF THESE  
STEPS. OPENING OF THE 1,3,4, TRIAZACARBAZOLE RING BY ALKALI OCCURS ONLY  
IN DERIVS. OF 2,MERCAPTO AND 2,HYDROXY,1,3,4,TRIAZACARBAZOLE, IN WHICH  
THE QUINOIDAL FORM IS FIxed BY METHYLATION AND MESOMERIC ION FORMATION  
IS EXCLUDED. ALTHOUGH CYCLIZATION OF 5-OXO 6 (2,AMINOPHENYL),1,2,4,  
TRIAZINES TO FORM 1,3,4,TRIAZACARBAZOLE DERIVS, FROM REACTION OF AMINO  
GROUP ON THE BENZENE RING WITH THE CARBONYL GROUP OF THE TRIAZINE RING  
IS POSSIBLE DURING CLEAVAGE OF 1,3,4,TRIAZACARBAZOLEs, THE REACTION  
PROCEEDS ONLY WITH MUCH DIFFICULTY.

"Charge Form factors of Li<sup>6</sup>, Be<sup>9</sup>, and C<sup>12</sup> Nuclei in a Three-  
Particle Cluster Model"

Tbilisi, Soobshcheniya Akademii Nauk Gruzinskoy SSR, vol 68, No 1,  
1972, pp 53-56

**Abstract:** This paper is the continuation of an earlier article by the same authors in the same journal mentioned above (Programma i tezisy 22-go yezhegodnogo soveshchaniya po yadernoy spektroskopii i strukture atomnogo yadra -- Program and Theses of the 22nd Annual Conference on Nuclear Spectroscopy and Atomic Nucleus Structures -- part 1, Leningrad, 1972, p 216; Soobshcheniya AN GSSR, 66, No 3, 1972, p 565) investigating the development of the K-harmonic method as applied to the nucleon association model. By using formulas developed in the earlier article together with the Reinal and Revai coefficients, the authors obtain in the present article expressions for the charge form factors of Li<sup>6</sup>, Be<sup>9</sup>, and C<sup>12</sup> three-particle nuclei. The authors promise a future article comparing the results of the present paper with available experimental data.

ABSTRACT/EXTRACT—(U) GP-0— ABSTRACT. THEORETICAL STUDY OF THE INFLUENCE OF THE SHAPE OF ENERGY BANDS ON THE FLUCTUATION PHENOMENON IN A NONEQUILIBRIUM SEMICONDUCTOR PLASMA. IT IS SHOWN THAT IN SEMICONDUCTORS WITH AN ANISOTROPIC BAND (AS WELL AS IN P TYPE GE AND SI) ANOMALOUS FLUCTUATIONS OF CHARGE DENSITY ARE POSSIBLE WHICH ARE ENTIRELY CAUSED BY THE SHAPE OF THE BAND AND THE ACTION OF A STRONG ELECTRIC FIELD. IN SEMICONDUCTORS WITH A NONPARABOLIC BAND, THE MAXIMUM SPECTRAL DENSITY OF THE CHARGE FLUCTUATIONS SHIFTS WITH A CHANGE IN THE EXTERNAL FIELD STRENGTH. THE EFFECT OF BAND SHAPE ON PLASMA WAVE ATTENUATION IS ALSO CONSIDERED.

"Conditions of Potassium Titanate Formation"

Moscow, Izvestiya Akademii Nauk SSSR, Neorganicheskiye Materialy, Vol 10,  
No 3, Mar 74, pp 460-464

**Abstract:** The interaction of  $K_2CO_3$  with  $TiO_2$  was studied to determine the phase composition products and conditions for the formation of potassium titanates. Different molar ratios of the initial compounds were mixed and roasted for four hours at 800-820°C with the resulting products subjected to chemical and x-ray analysis. The following compounds were formed:  $K_2O \cdot TiO_2$ ,  $2K_2O \cdot 3TiO_2$ ,  $K_2O \cdot 2TiO_2$ ,  $K_2O \cdot 4TiO_2$ , and  $K_2O \cdot 6TiO_2$ . Potassium titanates ( $12K_2O \cdot 13TiO_2$ ,  $K_2O \cdot 3TiO_2$ , and  $K_2O \cdot 5TiO_2$ ), reported in other literature sources, were not detected in the study. It was shown that the formation of potassium titanates proceeds by means of sequential reactions with the initial formation of potassium dititanate with potassium carbonate or  $TiO_2$ . Four figures, eight bibliographic references.

"Thermodynamics and Mechanism of Formation of Titanates in a Mixture of Lithium Carbonate and Titanium Dioxide"

Moscow, Neorganicheskiye Materialy, Vol 7, No 4, Apr 71, pp 648-651.

**Abstract:** A thermodynamic basis is provided for the primacy of formation of metatitanate in mixtures of lithium carbonate and titanium dioxide. In the system  $\text{Li}_2\text{O}\text{-TiO}_2$ , the formation of three titanates was confirmed: lithium metatitanate, dititanate, and trititanate. In mixtures of  $\text{Li}_2\text{CO}_3 : \text{TiO}_2$ , metatitanate is first formed. The lithium dititanate is formed by interaction of titanium dioxide with lithium metatitanate. Lithium trititanate is formed by successive reactions of titanium dioxide with the metatitanate and dititanate.

"Investigation of the Bending Strength of Layers in Multilayer Steels in Wide Temperature Interval"

Moscow, Zavodskaya Laboratoriya, Vol 39, No 1, 1973, pp 84-87

**Abstract:** The method and the results of experimental investigations of the resistance to direct pull and of the shearing strength of three-, five-, and seven-layer strips of St.2kp and 1Kh18N10T steels in the +20° to -196° temperature interval are described by reference to diagrams showing the experimental arrangement and the form of investigated specimens. The temperature dependences of the cut-off and ultimate direct pull stresses are shown. The experiments revealed that in multilayer steels, consisting of metals differing by the linear expansion

coefficient and the fracture transition temperature, the resistance to direct pull and the resistance to shear are in the investigated temperature interval on the bonding plane of the layers not lower than the corresponding characteristics of the less durable and more cold short metal component (St.2kp).

"Rupture of Multilayered Steel During Dynamic and Static Application of Loads"

Moscow, Izvestiya Akademii Nauk SSSR -- Metally, No 5, 1970, pp 132-136

**Abstract:** This article contains a study of the relation of the number and arrangement of layers of multilayered steel to its ductile properties. The basic factor here is not only the ductility level at room temperature but also the nature of its variation at lower temperatures. It is important that the types of steel selected as the component metal differ essentially with respect to their resistance to cold. Samples of 3-, 5-, and 7-layer material made of St.2kp and 1Kh18N10T steels were tested to study this problem. The test were performed in the temperature range from +20°C to -100°C. The impact toughness was also determined at the boiling point of liquid nitrogen. By comparing the temperature discontinuity of the impact toughness, it is clear that the amount of ductile steel 1Kh18N10T in the multilayered sample is not the defining factor for cold resistance. The number of layers in the strip has a much greater effect. Within the limits of each group, with an increase in the number of layers, the temperature discontinuity of the impact toughness drops noticeably, i.e.,

1/3

USSR

NAVROTSKIY, I. V., et al, Izvestiya Akademii Nauk SSSR -- Metally, No 5, 1970,  
pp 132-136

the cold resistance of the material increases. High values of impact toughness  
are noted for very low temperatures.

When testing layered materials using samples with a notch through the  
outside layer, the crack intersects each layer on being propagated. With a  
certain combination of metal component properties, the propagation of the  
crack can take place discontinuously, stopping at the boundary of the ductile  
layer with generation of a new crack. This nature of rupture requires addi-  
tional energy absorption, which explains the very high absolute values of the  
impact toughness obtained when testing such samples. It is pointed out that  
the more frequently the layers of the tested types of 1Kh18N10P and St2kp  
steels are alternated and the more layers there are in the sample, the more  
uniformly the St2kp steel is strained in the multilayer object. The surface  
of the notch in a 7-layer sample is coated with a network of fine cracks which  
go from one steel to another. Against the background of this grid, several  
well-developed cracks are to be seen, and the opening of the cut is appreciably  
greater than in samples made of 3-layer steel.

USSR

NAVROTSKIY, I. V., et al, Izvestiya Akademii Nauk SSSR -- Metally, No 5, 1970,  
pp 132-136

Thus, by creating multilayer compositions it is possible to lower, appreciably, the threshold temperature of cold brittleness of brittle steel. The resistance to brittle fracture of the multilayered sample depends to a significantly greater extent on the number of layers and their arrangement than on the total content of ductile steel. This is connected with variation of the kinetics of formation of the main crack and an increase in the plasticity of the brittle component. Significant savings of nickel steel (up to 50-60%) are possible as a result of formation of interstitial layers in them of ferrite class steel while retaining sufficiently large energy capacity of the metal at low temperatures.

"A Device for Automatic Quantitative and Qualitative Monitoring of Elec-  
trical and Time Parameters"

USSR Author's Certificate No 264794, filed 27 Dec 67, published 2 Jul 70  
(from REh-Radiotekhnika, No 6, Jun 71, Abstract No 6A327 P)

Translation: A device is proposed for automatic quantitative and qualitative monitoring of electrical and time parameters. As a distinguishing feature of the patent, in order to reduce time and increase accuracy in localizing trouble spots in cable conductors, the device contains a trouble localizing unit in which the control input of the shift register is connected to the output of the data processing module, while the signal and control outputs of the shift register are connected to the control inputs of the block of output devices and the commutation module respectively. The control inputs of the switches of each of the cells of the high-voltage commutation circuits are connected to the outputs of a two-position storage element whose input is connected to the output of the commutation module through the commutation leads of one of the switches.
